57/100

× REJECTED — THRESHOLD: 70

This idea scored below 70. Work through the guidance below and resubmit a refined version.

Value Proposition

14/25

The idea addresses a real friction point — clients struggle to discover and vet local/independent performers, and artists lack professional showcase tools. However, the differentiation is thin; platforms like GigSalad, Bark, and Thumbtack already connect clients with performers. The AI-generated writeup and critique add novelty but may not be compelling enough on their own to displace entrenched habits. The target customer on both sides (artist and client) is broad and undefined.

SUGGESTIONS

- Narrow the target segment sharply — e.g., corporate event planners, wedding coordinators, or restaurant owners — and design the entire UX around their specific vetting needs rather than general browsing.
- Make the AI critique genuinely useful and differentiated: go beyond genre tagging to provide quantified quality scores, crowd-response simulation, or style-matching to event types, so clients trust it as a decision-making tool.

Business Benefits

10/25

The gig entertainment market is real and sizeable, but a one-time registration fee model is fragile — it creates misaligned incentives (list and forget), caps recurring revenue, and is easily undercut by free alternatives. Once artists pay and list, there is little reason to stay engaged or for the platform to keep improving artist profiles. Competitive moat is essentially zero at launch.

SUGGESTIONS

- Replace or supplement registration fees with a commission or subscription model: take a percentage of each confirmed booking or charge artists a monthly SaaS fee for profile analytics, priority placement, and AI performance coaching reports.
- Introduce a client-side revenue stream — charge event planners or venues a small fee per booking or offer premium search/filtering tools — to reduce dependency on artist registration

revenue alone.

Feasibility

16/25

The core tech stack — video upload, AI music analysis (genre detection, quality assessment), and automated copywriting — is achievable today using existing APIs (e.g., OpenAI, ACRCLOUD, Google Video Intelligence). The main operational challenge is content moderation, quality-gating, and building a two-sided marketplace from zero, which requires simultaneous supply and demand acquisition. No major regulatory barriers exist.

SUGGESTIONS

- Use off-the-shelf AI APIs for music genre detection and LLMs for writeup generation rather than building custom models; this dramatically reduces initial engineering effort and time.
- Define the 'pre-determined criteria' for listing approval as a simple, transparent rubric (audio clarity, minimum performance length, genre tags confirmed) and automate as much of the gatekeeping as possible to avoid costly human review at scale.

Time to Market

17/25

An MVP — video upload, AI-generated profile, basic browsing — could realistically be built in 3–5 months by a small team using available APIs and no-code/low-code scaffolding for the portal itself. The technical blockers are low. The bigger time risk is not building but bootstrapping the two-sided marketplace: an empty directory has no value to either side.

SUGGESTIONS

- Launch a 'fake door' MVP first: manually curate 20–30 artist profiles using the AI tools before the portal is fully self-serve, so early client visitors see a populated, credible marketplace from day one.
- Target a single city or niche event type for the initial launch to concentrate supply and demand geographically, making the marketplace feel full faster and reducing cold-start friction.

Overall Guidance

1. Rethink the revenue model urgently — registration fees alone will not sustain growth or align platform incentives with artist success; move toward commissions or subscriptions tied to booking activity.
2. Solve the cold-start problem deliberately by manually seeding artist profiles in one city or vertical before opening self-serve registration, otherwise both sides will arrive to an empty platform.
3. Sharpen the buyer (client) experience — the portal lives or dies by whether event planners and clients trust and use it; invest as much in client-side features (search filters, booking flow, reviews) as in AI profile generation.

4. Define a clear moat beyond AI writeups — consider exclusive artist verification badges, performance history tracking, or integrated payment/contract tools that competitors lack.
5. Validate willingness to pay on both sides before building: run a concierge version manually with 10 artists and 5 clients to confirm registration fee and booking conversion assumptions.

Key Risks

- ⚠ Two-sided marketplace cold-start: without enough listed artists, clients won't visit; without client demand, artists won't pay to register — this chicken-and-egg problem has killed many similar platforms and requires a deliberate, funded acquisition strategy to break.
- ⚠ Competitive displacement: GigSalad, Bark, and Thumbtack have existing supply, demand, and SEO dominance; unless the AI differentiation is perceived as dramatically superior by clients — not just novel — user acquisition costs may make the business unviable.
