60/100

× REJECTED — THRESHOLD: 70

This idea scored below 70. Work through the guidance below and resubmit a refined version.

Value Proposition

17/25

The idea addresses a genuine trust deficit in the gig-cleaning market — clients struggle to vet independent cleaners, and cleaners struggle to differentiate themselves. The video-based skill verification is a meaningfully differentiated hook versus generic marketplace listings. However, the target customer (homeowners seeking independent cleaners) is still fairly broad, and the core 'AI evaluation of technique' claim needs to be substantiated — most homeowners don't know what 'good technique' looks like either, so the trust signal must be translated into something viscerally reassuring.

SUGGESTIONS

- Narrow the initial customer segment — e.g., time-poor urban renters or Airbnb hosts who need reliable, recurring cleaners — to sharpen messaging and reduce acquisition cost.
- Make the quality score human-interpretable with a simple checklist summary (e.g., 'Uses EPA-approved products,' 'Demonstrated grout scrubbing technique') rather than a black-box AI score, which skeptical clients may distrust.

Business Benefits

13/25

The home cleaning market is large (~\$20B+ in the US), but the revenue model is thin and fragile. Relying on registration fees from supply-side participants (cleaners) caps revenue potential quickly, and premium placement upgrades are a notoriously low-conversion upsell in early-stage marketplaces. The platform risks being perceived as a cost center by cleaners who haven't yet seen booking ROI. There is no transaction fee or subscription model mentioned, which leaves significant revenue on the table.

SUGGESTIONS

- Introduce a per-booking commission (typically 10–20%) as the primary revenue engine — this aligns platform incentives with cleaner success and scales with marketplace volume.

- Add a client-side subscription tier (e.g., priority access to top-rated cleaners, recurring booking discounts) to diversify revenue and improve customer LTV.

Feasibility

14/25

The portal and booking mechanics are standard and buildable. The hard part is the 'AI evaluation of technique, efficiency, and safety practices' from short videos — this is a computer vision problem that is non-trivial, prone to error, and potentially liability-generating if it wrongly certifies an unsafe cleaner. A lean founding team would likely need to fake or heavily augment this with human review initially, which increases operational cost and slows onboarding. Background checks, insurance verification, and safety compliance also add regulatory and operational complexity.

SUGGESTIONS

- Launch with human reviewers scoring videos against a rubric (5–10 criteria), then layer in ML-assisted scoring only once you have labeled training data from hundreds of cleaner videos — don't lead with 'AI evaluation' as the technical centerpiece.
- Partner with an existing background-check API (e.g., Checkr) and liability insurance provider from day one to offload compliance complexity and make the trust proposition credible to clients.

Time to Market

16/25

A functional MVP — profile creation, video upload, human-reviewed scoring, and booking flow — is achievable in 4–6 months with a small technical team using existing tools (no-code/low-code for the portal, Stripe for payments, a video hosting API). The blocker is the cold-start problem: the platform needs enough quality cleaner profiles before it can convert even the first client, meaning supply-side onboarding must begin before the demand side is live. Regulatory requirements around payment processing and potential worker classification laws (especially in California) could add timeline risk.

SUGGESTIONS

- Launch in a single metro area with a targeted cleaner recruitment push (Facebook groups, local flyers, referral bonus) to build 30–50 quality profiles before opening the platform to clients — treat it as a 'closed beta' with real transactions.
- Use a no-code stack (Webflow + Airtable + Zapier + Stripe) for the first version to hit market in under 3 months and validate demand before investing in custom development.

Overall Guidance

1. Fix the revenue model first: replace or supplement registration fees with a per-booking commission — this is the only model that scales with marketplace health and aligns your incentives with cleaner success.

2. Don't over-promise on AI: the 'AI evaluation of technique' is the most technically risky and legally exposed claim; launch with transparent human review and position AI as an enhancement, not the foundation.
3. Solve the cold-start problem explicitly: define your launch city, your cleaner recruitment playbook, and a minimum viable supply threshold (e.g., 40 published profiles) before spending a dollar on client acquisition.
4. Build trust signals that resonate with clients beyond scores — insurance verification badges, background check confirmation, and short video previews are more immediately credible than an algorithmic quality number.
5. Validate willingness to pay on both sides early: run a manual concierge pilot with 5–10 cleaners and 20–30 clients before building the full platform to confirm booking frequency, price sensitivity, and retention.

Key Risks

- ⚠ Supply-side monetization trap: charging cleaners registration fees before they've earned bookings will cause high churn and poor-quality sign-ups — the platform could end up with a large pool of unbooked, disgruntled cleaners who damage the brand and stall growth.
- ⚠ AI liability exposure: if the platform's automated evaluation certifies a cleaner who then causes property damage or personal harm, the 'AI quality score' becomes a legal liability rather than a value-add — without robust human oversight and clear disclaimers, this risk could be company-ending.
